

OGC API – Coverages

OGC API – DGGS

Cartographic Symbology

Participation Plans for OGC Code Sprint 26

October 9, 2025

Jérôme St-Louis, Co-chair

OGC API - Coverages

- We are getting close to completing the agreed upon edits: 21 issues still open; +16 in review (most of which we should be able to quickly review and close), with one more session next week before the sprint
- We hope to present a completed draft to the SWG to start a vote for the OAB review soon, hopefully at the Members Meeting.
- We might try to finalize the document at the sprint, especially if Joan has some free time to help me with this. In particular, we need to put together a comprehensive Examples Annex and/or embedded examples next to the requirements
- I have some work to do on my implementations to update to the latest changes (e.g., new resolution parameter for scaling/resampling), so that is something else I might work on
- Welcoming participants to review the document and implement / update their implementation to the latest draft

OGC API - DGGS

- The Standard is approved and is in the final stages of publication
- The AI-DGGS pilot is on-going, and great work is happening there in terms of implementation, clarifying various things about the API and DGGS concepts, as well as working towards definitions of additional Discrete Global Grid Reference Systems beyond those in Annex B (e.g., H3, S2, A5)
- If pilot participants are at the sprint, that might be one thread of interest
- Welcoming participants to leverage DGGAL following the tutorial session and I'll be there to answer any questions and help out
- On our implementation's side (DGGAL / GNOSIS Map Server), I want to finalize the 7H sub-zones support (for pentagonal ancestral zones), and also add support for DGGS-JSON-FG

Cartographic Symbolology

- We've recently made significant progress on libCartoSym intended as a open-source reference implementation
- On-going work: compare the implementation and the document to ensure they align
- Next steps: Support for CartoSym-JSON (currently CQL2-JSON input, which is a big subset, is supported) -- I may work on this at the sprint,
- Polish and document the libCartoSym API, provide bindings for different languages, packaging -- I may also work on this at the sprint,
- More next steps: Integrate libCartoSym with renderers (e.g., MapServer, GeoServer, GNOSIS Map Server...) -- that would be very interesting topic to work on at the sprint to work on,
- Leverage the output of these renderers to provide visual examples throughout the standard document for reference
