Building Blocks

GeoDCAT implementation using OGC API Records

About this register

Building Blocks list / GeoDCAT mapping for OGC API Records

GeoDCAT mapping for OGC API Records Schema Under development

ogc:geo:geodcat:geodcat-records

GeoDCAT profile of OGC API Records binds the OGC API Records schema to the GeoDCAT profile of DCAT. This is a work in progress to establish the scope of GeoDCAT to semantically describe existing spatial metadata schemas available profile.

All examples and tests for this building block pass validation. [VALIDATION REPORT](#)

Description

GeoDCAT implementation using OGC API records JSON schema

This building block defines a binding from OGC API Records schema to the GeoDCAT profile of DCAT.

This profile extends a building block that uses the official JSON-LD context for DCAT bound to the OGC API Records.

This building block is expected to be stable, whilst the GeoDCAT profile is under development.

DCAT and OGC API - Records

This track will focus on the discussion and building of a [DCAT-AP profile for OGC API - Records](#), using the [OGC Building Blocks CI/CD framework](#).

Using the Building Blocks CI/CD framework also helps to provide real-world experience in the adoption of the framework for Building Block creation and the challenges using the framework.

Challenges:

- What 'granularity'?
 - Dataset+Distribution+Datatervice as 1 record or Dataset, Distribution, Datatervice as separate records
- DCAT-AP + extension for additional profiles?
- Mapping between 'properties' and/or links section
- Inheritance json/json-ld schemas
- Workflow with forks for BuildingBlock repositories
- ...
